

MunimAI

Voice-first bahi khata that can collect, match and settle money.

For dairy shops, chaat thelas and Indian shop owners who still trust handwritten ledgers (*bahi*), but now need UPI, reminders and clean day-end hisaab.

Team Name: Rajdhani

The shop has money everywhere

Small merchants do not lack payments. They lack one trusted view of who paid, who owes and what changed.

This is why “payment received” still does not mean the bahi is settled.

Do not replace bahi. Make it programmable.

The merchant keeps the natural workflow: bolna, likhna, hisaab. The agent turns it into structured financial state.

Key idea: the bahi becomes an agentic ledger. Not just a notebook, not just a payment app.

Awaaz se Lekha, Vyapaar aur Vishwas

Boliye, likhiye, badhiye.

Awaaz se Entry
Boliye, aur lekha
tayaar.

Digital + Bahi Khata
Dono ka saath,
har din ki baat.

Vishwas aur Spashtata
Saaf lekha, mazboot
rishta.

What MunimAI does

A voice-first financial agent for micro-merchants.

Voice bahi entries

Sales, udhar, cash and supplier dues spoken in natural language.

Razorpay collection

Create exact payment links or dynamic QRs for outstanding dues.

Auto-matching

Incoming Razorpay payment events close the correct ledger entry.

Daily hisaab

Ask "aaj kitna aaya?" and get a clean cash/UPI/udhar summary.

Merchant interface: voice. Financial execution: Razorpay.

Three flows judges can understand immediately

No abstract “AI for fintech”. Each flow is a concrete shopkeeper job.

Udhar collection

“Ramesh ke ₹340 udhar hain”

Agent sends payment link →
payment event → Ramesh balance
drops to ₹0

Payment Matching

“1 kg daal ka bill banao”

Creates a dynamic QR code that
the customer can pay through. It
also creates data points that can be
later used for analysis.

Supplier payable

“Kal Amul wale ko ₹8,200 dena hai”

Agent tracks due date → prepares
RazorpayX payout → merchant
approves

Each flow can be replayed in a sandbox: create event → agent reasons → Razorpay test event confirms.

36-hour build scope

Small enough to ship. Strong enough to show the Razorpay primitives working together.

Demo stack

Frontend	Next.js merchant console + Hindi voice/text input
Agent	LLM for parsing + deterministic ledger tools
Ledger	SQLite/Postgres: customers, dues, events, audit log
Razorpay	Test mode Payment Links/QR + webhook simulator
Safety	Approval required for payout/refund-like actions

Live demo script

- Merchant speaks an udhar entry
- Agent updates Ramesh's bahi balance
- Agent creates a Razorpay test payment link/QR
- Payment succeeds in test mode
- Webhook auto-closes the ledger entry
- Merchant asks: "aaj ka hisaab?"

No real money required: everything can run in Razorpay Test Mode with replayable webhook events.

WHY THIS CAN STAND OUT

Not another dashboard.

- Built around bahi khata behavior instead of forcing POS habits
- Converts informal udhar into collectable Razorpay payment requests
- Uses payment events as ground truth, not manual “paid” buttons
- Creates future rails for supplier payouts, credit, reminders and bookkeeping

From handwritten trust → programmable money.
